Description

Climate Change is a large and complex issue, often leaving people with a vague understanding and without a feeling personal ownership.

The bearers of a future affected by climate change are the ones that often have the smallest voice in decisions made today.

This site gives children a viable resource for information and the tools for appropriate action.

Features

- HTML and CSS website built from scratch
- Actionable movement using Javascript for dynamic site
- Matching information with user input to create individually tailored action plans

Planning - User Stories

Inspired by young Sunrise Movement advocates meeting with Senator Dianne Feinstein as well as the understanding that the global event of climate change will be expressed in regionally specific ways, I wanted to create an informative website geared toward children with the goal of daily steps of positive change.

An individual user of this website will find the information clear and tone age-appropriate. A complete journey through the website will end with motivation, as the focus is on action, not future calamity.

Technology Stack

- HTML, CSS, JavaScript
- Angular
- Visual Studio Code

What I Learned

- JavaScript as a language as well as advanced methods in CSS formatting.
- Leading information into action using design and formatting for website.
- Creating individual experience for user without creating recordable data.

What's Next

- A customizable website that users can track action and set goals.
- A shared community board for expanding beyond individual action
- Learning something else new!
